

White American Beautyberry

Callicarpa American lactea

This is an outstanding native Texas deciduous shrub reaching 6'-8' tall. Spring brings tiny white flowers borne in clusters along the leaf axils. In the fall, milky white berries appear in tight clusters. These berries seem to glow in the dark making this plant a great addition to "moon gardens".

These berries remain long into winter, & are eaten by several species of birds. Full sun to dappled shade. Drought tolerant once established. Responds well to pruning. Birds!
